

## *Aftercare Instructions: Eyebrows*

For the first 48 hours, you will have some discomfort and slight redness on your eyebrows. You may take any over-the-counter pain medicine. Do not apply any ointment on your brows. They will build a scab and you **MUST NOT** peel it off or you risk losing color. On the fifth night, apply ointment on your brows. That following morning, the scab will start to flake off. Let it come off naturally on its own. Continue to apply ointment morning and night, even after the scabs fall off, for the next few weeks to help your brows to heal.

### *General Aftercare:*

- You can wash your face like normal, but blot your eyebrows dry. **DO NOT RUB.**
- Wash your hands before touching your eyebrows.
- Some itching is normal. **DO NOT PICK, PEEL OR SCRATCH** your eyebrows or your color may heal unevenly and you risk scarring or infection.
- Do not expose your healing skin to direct sunlight or tanning beds.

### *Long-Term Aftercare*

- Use a good sunscreen daily. Sun exposure will fade your permanent cosmetics.
- Put a light coat of Vaseline on your eyebrows before applying moisturizer. Many moisturizers contain alpha hydroxy acid which will cause your color to significantly fade.

### *Touch-up Procedure Information:*

If you would like to make any changes to your permanent makeup, please call to schedule an appointment two months after your original procedure. Touch-ups are \$25 each, if done within a six month time frame from the original procedure. After six months, the price is adjusted based on evaluation.
